244 825 particular suffers greatly from this type of ant, but maize, tajer, and bananas are also eaten. This plague is so serious that the clearing of a new ground is partially determined by the occurrence of the nests of these ants at the place. Normally these nests lie fairly far apart in the forest, but as soon as the crops of the grounds come within the domain of the ants, the nests grow rampantly. In addition, at just about planting time the ants produce numerous sexual forms, which, as a result of the cleared lands, have a favorable opportunity to swarm and found new colonies. The leaf-cutting ants are therefore "Kulturfolger" /followers of culture/.

As a result of this plague of ants, it is usually not possible for the Bush Negroes to cut extensions to the existing grounds for longer than two to three years. After all, the kapoeweri of the abandoned pieces of ground functions then as a hiding place for the younger ant-nests, and one drags, as it were, the ant plague along with one. There is no combating the ants, and through impotence the Bush Negro is forced to yield the field. This flight before the ants consists in the search for new grounds farther into the bush or, in case this is no longer possible for some reason, in the occupation of new lands elsewhere along the river.

137 136 /139/ Stahel (1) has pointed to the fact that among the Bush

Negroes the older grounds change into a low second-growth, called by him "ant-kapoeweri" /ant-bush/. In effect, in many places where a dense Bush Negro population is found, such a strip of second growth occurs along the rivers. According to Stahel, this inferior bush comes about through the presence of the great nests of leaf-cutting ants. According to his calculation, at a density of six ant nests per hectare (a maximum which is confirmed in the vicinity of Paramaribo, but which, according to my own observations in the Bush Negro lands,

Introduction

BR 101 [122] During the expeditions of the Institut géographique national in French Guiana in 1948 and 1949, we lived in close contact with the Boni Refugee Blacks and the Oayana /Oyana/ Indians of the Upper Maroni. These populations present the remarkable peculiarity of belonging to two entirely distinct ethnic groups while living side by side, leading in general the same way of life, and having the BR 121 same diet. Historical circumstances have thus joined together in the Upper Maroni the conditions of a rigorous biological experiment which, so far as we know, do not exist so distinctly in the other regions. In fact, wherever two different ethnic groups coexist, they usually do not have either the same habitat or the same way of life; for example, on the coast of Surinam the Indonesians live mostly on the rice plantations and the Blacks in the towns, under quite different conditions of habitat, diet, and hygiene; BR 114 121 under these conditions, the differences observed on the level of pathology and demography are difficult to interpret.

Doctor André Sausse, who accompanied us, studied the Boni and the Oayana Indians on the medical level; he submitted evidence that these two populations presented a distinct pathology having BR [113] profound repercussions on their demographic situation (1). During

BR 101 114 121 [122] this period we lacked the time to substantiate these data by a census and by a systematic interrogation of the women. We were able to carry out this work at the close of the expedition for the delimitation of the southern frontier in January, 1957. The data collected have been verified and completed in the course of two other expeditions made for the Office de la recherche scientifique dans les territoires d'Outre-Mer /Bureau of Scientific Research in the Overseas Territories/ (October 1957 – February 1958 and

611 /18/ Villages and Kin Groups

Among all the kinship systems which existed in the African tribes from which they issued, the Refugee Blacks came back unanimously, and from the beginning, to matrilineal filiation.

571 613 643 Their social system is symbiosis, under the authority of the grand man, of a certain number of localized matrilineal kin groups.

613 Matrilineal kin groups of the Boni. With the Boni the basic grouping is the lineage, in the rigorous sense of the term, understanding by that all descendants in maternal line from a single ancestress.

To designate the kin groups the Boni employ almost interchangeably the words lo (troop, band) and bɛɛ, womb. In fact these expressions correspond to two variant interpretations of the same notion:

614 bɛɛ: matrilineage in the widest sense, understanding by that all persons knowing that they are issue of the same ancestress, even if the genealogical ties are forgotten, and even if these persons are scattered in several villages under different authorities;

lo: lineage fraction grouped in one village and constituting a distinct social unit.

The lineage bears a name whose origin is forgotten by present-day Boni; some of these names allude to a plantation or to a slave-owner, for example Lapé (La Paix: a plantation of the Cottica River); as for others, the name of the founding ancestress may be involved. Examples: Kawina (name of the lineage constituting the village of Papaïkou).

/41 cont./

621 613 [591] The principle behind the constitution of the Boni villages is, as we have said, the localization of the matrilineage. Men and women live in the village of their maternal kin; the wife does not leave her village to join her husband, who comes to visit her from time to time without ceasing, himself, to live in the midst of his own lineage.

The composition of each village thus corresponds, at least in principle, to the group of living people on the genealogical table. But a certain number of exceptions are observed:

[167] -A certain number of men (about 20 out of 800 persons) have emigrated for good and can no longer be counted in the population of the villages;

[619] [591] -On the other hand, a dozen Djuka and Saramaka married to Boni women have settled permanently in the villages and have been included in the census.

125 128 [173] We have tried to estimate with as much precision as possible the age of the people concerned, by means of events of known date which they remember, from the trip of the explorer Crevaux (1878) to the war 1939-45. We have established a local chronology, reproduced as an appendix at the end of the present chapter.

125 The demographic survey, which has been the subject of another publication (1), was conducted parallel with the sociological investigation.
